## **DHCP Reservation Synchronization**

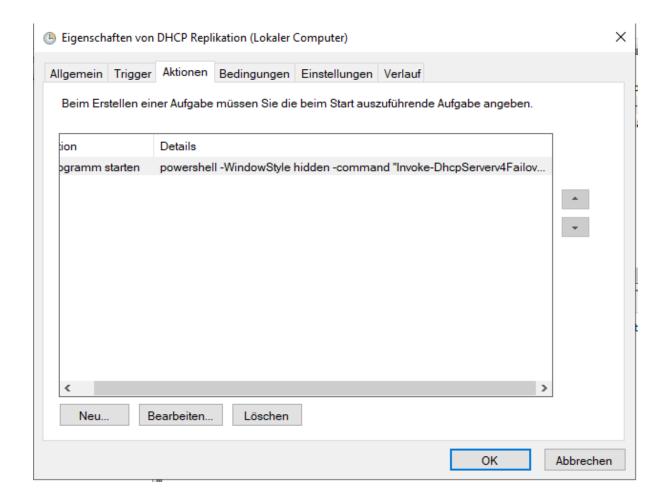

When two Windows DHCP Servers are configured in Failover manner, by the functional architecture from Microsoft they do not synchronize when a DHCP reservation or a change is made on one server. To solve this problem either you have to manually replicate the changes by right clicking on the DHCP Scope or by running a Powershell command. But it is not so nice if you forget to do that, which is normal because we do not do DHCP reservation everyday. But we can automate the process by running a Scheduled Task triggered when a change is made on one server. Below the steps are noted:

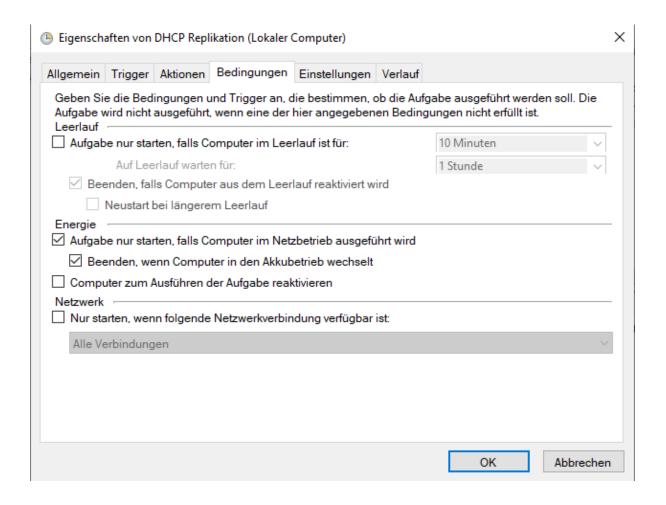

- 1. Set the DHCP failover mode to Active-Active Load Balance
- Enable DHCP Server Operation Logging. Open up Log viewer > Application and Service Logs >
  Microsoft > Windows > DHCP-Server. Then enable or activate the following log:
  Microsoft-Windows-DHCP Server Events/Operational
- Create a Scheduled Task with a trigger by this log:
  Microsoft-Windows-DHCP-Server Events/Operational
  The command it should perform:
  Program / Script: powershell

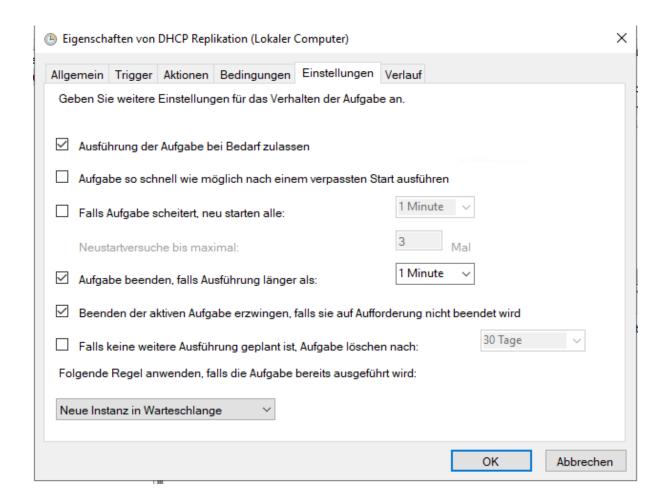

Command: -WindowStyle hidden -command "Invoke-DhcpServerv4FailoverReplication - Force"

That's it. Now test it creating a reservation or changing something on the primary server, it will triggert riggen the powershell command and synchronize the change to the other server automatically.
